

Stock Lifecycle User Training Guide

End-to-end operator manual for stock opening, physical count, packing EOD count, monthly proof, stock-card drill, and annual FY close.

Main route /inventory/stock-lifecycle	Packing EOD route /logistics/packing/consumption	Use for Opening, counts, snapshots, history, stock-card proof, FY close
Do not use for GRN, WCM issue, output log, dispatch, or packing execution	Partial counts Plant, location, item, stock class, roll form, or granule code	Golden rule Only rows with entered counted quantity post

Operator promise: if an item was not physically counted, leave it blank. Blank rows are ignored and stay unchanged.

1. What This Module Controls

Stock Lifecycle is the inventory control cockpit. Other modules create movement. Stock Lifecycle proves, corrects, snapshots, and closes the inventory balance.

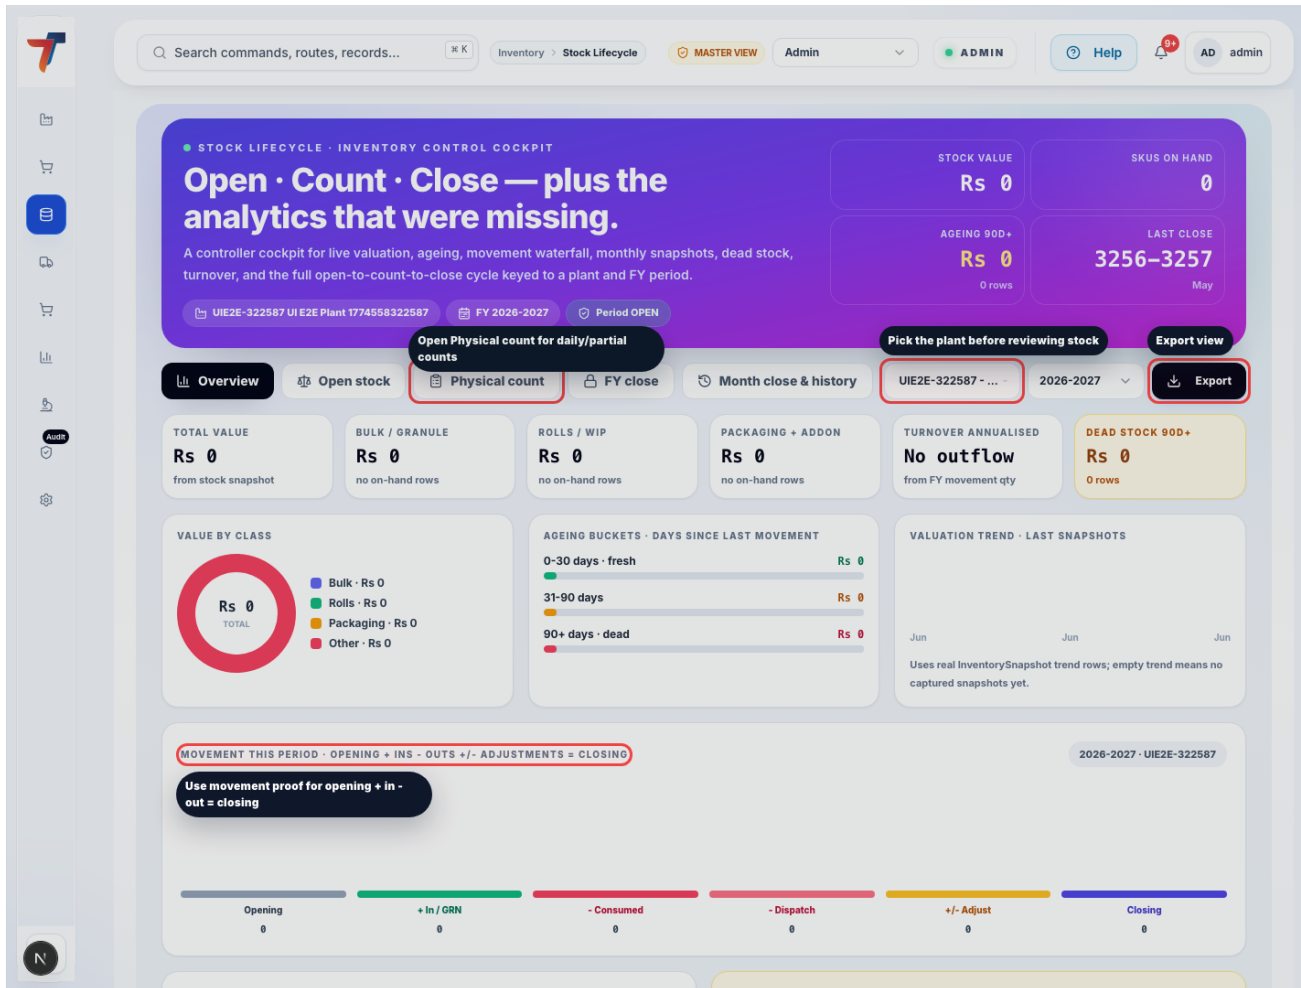

Area	Use Stock Lifecycle for	Do not use it for
Opening stock	First FY opening or migration stock, by material, location, roll label, and packing item.	Daily inward GRNs after operations are live.
Physical count	Full or partial count by plant, location, item, stock class, roll form, or granule inward code.	Issuing material to WCM or recording machine output.
Packing EOD	Closing manual packing SKUs from Packing EOD or Physical count with Packing scope.	Inner pouch and gonny execution already posted by packing flow.
Month close	Monthly reporting snapshot plus count-sheet proof. No lock.	Annual FY locking.
FY close	Annual Indian FY lock after all blockers are cleared. Creates next opening.	Daily or monthly count work.

Common misunderstanding: Month close is a reporting snapshot. FY close is the annual lock. They are intentionally separate.

2. Button And Tab Map

Button / tab	When to click	What happens
Overview	Start here at the beginning of the day or before review.	Shows valuation, class split, ageing, movement waterfall, dead stock, and trend status.
Open stock	Only for first migration or FY opening stock.	Posts opening audit sheet. Do not use for normal GRN.
Physical count	Daily count, surprise audit, EOD count, item correction, roll-form count, or granule-code count.	Builds and posts a physical count batch from entered rows only.
FY close	At annual close after all draft sheets and blockers are cleared.	Locks the FY and creates the next opening batch.
Month close & history	At month-end and whenever proof is needed.	Shows monthly tracker, audit sheet history, stock-card drill, and capture month-end snapshot.
Export	When a controller needs Excel evidence.	Exports the current view where supported.
Post physical count	After counted rows are entered and required reasons are filled.	Posts variance movements and creates immutable audit proof.
Capture month-end snapshot	Current month only, after month-end count work.	Captures live stock as a monthly reporting snapshot. FY remains open.
Close Financial Year	Only after blockers show clear.	Closes the annual FY. This is not reversible as a daily operation.
Packing EOD - Post count	At packing yard EOD for manual packing materials.	Short stock becomes packing consumption; excess becomes count adjustment.

3. Overview - Read The Stock Position First

Screenshot captured from the local running stack with guide callouts.

Plant and FY selectors

Always verify plant and financial year before trusting numbers.

Physical count tab

Use this for daily counts and partial counts.

Movement proof

Opening + Ins - Outs +/- Adjustments = Closing. Use this before arguing with totals.

Export

Use export when the review needs a file trail.

4. Physical Count - The Daily Operator Flow

Scope buttons

All, Bulk, Rolls, and Packing decide the stock class in the count batch.

Location filter

Use this for store-wise or yard-wise count. Only selected rows post.

Roll form filter

For rolls, filter by open web, lay-flat tube, or folded web when form matters.

Granule code filter

For bulk/granule stock, count only one inward code without affecting other codes.

Post physical count

Disabled until at least one row is valid. Variance over 2 percent needs a reason.

Use Physical count for plant-wide, location-wise, item-wise, class-wise, roll-form, and granule-code counts.

5. Worked Examples - What To Enter

Example	Screen setup	What to enter	Expected proof
Granule code partial count	Physical count -> Bulk -> location Raw Store -> granule inward code A.	Enter counted kg only on code A rows. Leave code B blank.	Code A posts short/excess movement. Code B remains unchanged.
Roll stock-form count	Physical count -> Rolls -> roll form Lay-flat tube.	Enter counted qty for physical roll labels checked. Add reason if variance crosses threshold.	Audit line stores roll label, material, width, thickness, grade, status, and stock form.
Packing EOD count	Packing EOD page or Physical count -> Packing -> Packing Yard.	Enter closing qty for counted manual packing SKUs.	Short = packing consumption. Excess = count adjustment. Sheet appears in Stock Lifecycle history.
Item-only surprise count	Physical count -> search exact item code/name.	Enter counted qty for that item only.	Only that item posts. Unentered items do not become zero.
Location-only cycle count	Physical count -> location filter -> leave uncounted rows blank.	Enter only rows physically checked in that location.	Batch label says location partial count and preserves location metadata.

Reason rule: if variance is 2 percent or more, write a real reason: damage found, missing bundle, wrong location, supplier shortage, label mismatch, or counting correction.

Copy book qty when physical equals system

Copy book qty

Post count

Post count into the same stock-cycle truth

Short = consumption, excess = adjustment

Posting rule

Same-day allocation pool

No packing throughput on this date.

Short stock becomes packing consumption.

Excess stock becomes count adjustment.

Allocation only uses orders that allowed that material.

Stock Lifecycle reads the updated packing balance.

Date

Use the actual EOD count date.

Copy book qty

Use only when physical stock equals the system balance.

Post count

Posts the packing count into the same audit/stock lifecycle truth.

Posting rule

Short stock becomes packing consumption. Excess stock becomes count adjustment.

Stock Lifecycle chip

Jump back to the Stock Lifecycle count/history proof.

Packing EOD is not a separate truth. It is a focused shortcut for packing stock counts.

Totals						

This is the annual FY lock. Monthly stock snapshots are posted from Month close & history.

Close Financial Year only after blockers are clear

Close Financial Year

All categories Bulk Film 38 Rolls 50 Granule 63 Ink 30 Solvent 3 Adhesive 13 Packaging 27 Add-ons 13 POD 18

Closing math

Review class-wise opening, inward, outward, adjustment, closing, and value.

Close Financial Year

Click only after blockers are clear and numbers are approved.

Result

System creates a locked close batch and a next-year opening batch.

If blocked

Go to Month close & history and cancel unfinished draft sheets or resolve operational blockers.

The final close action is intentionally separated from monthly snapshot work.

11. End-To-End Operating Sequence

When	Operator action	Button / tab	Proof to check
First setup	Enter beginning balances by material/location/label.	Open stock -> Post Opening Stock	Opening audit sheet in history.
Daily raw count	Count actual raw stock for checked rows only.	Physical count -> Bulk -> Post physical count	Count batch and stock card movement.
Daily roll count	Count roll labels and stock forms.	Physical count -> Rolls -> roll form filter	Roll audit line with label/form/status.
Packing EOD	Count manual packing SKU closing balance.	Packing EOD -> Post count	Packing transaction and Stock Lifecycle audit history.
Month end	Capture current month stock proof.	Month close & history -> Capture month-end snapshot	Monthly tracker updated; FY remains open.
Controller review	Explain any material balance.	Month close & history -> Stock card drill	Opening + movement = closing.
Annual close	Clear blockers, approve closing, lock FY.	FY close -> Close Financial Year	Closed FY plus next opening batch.

Use this exact sequence during training. The system supports partial counts, but the training example should start with one location and one or two items so operators see what changes and what does not.

12. Operator Checklist And Troubleshooting

Question / problem	What to do
The Post button is disabled.	Enter at least one counted quantity. If variance is over 2 percent, add a reason. If a found row has no location, select a location.
I only counted one item. Will other items become zero?	No. Blank rows are ignored. Only rows with entered counted quantity post.
Where do monthly closes happen?	Month close & history. Use Capture month-end snapshot for the current month. It does not lock the FY.
Why is FY close blocked?	Look at Annual close blockers. Draft count/opening sheets can be cancelled from Month close & history if unfinished.
Where do packing counts show?	Packing EOD posts into the same Stock Lifecycle proof. Check audit history and stock card; packaging proof is via packaging transactions plus posted audit sheets.
How do I prove a balance to management?	Open Month close & history, use Stock card drill for the material and FY, then export if needed.
What if a counted row has a large variance?	Do not post without a real reason. Write damage, missing bundle, found in another location, issue not recorded, or count correction.

Before posting any count	After posting any count
Correct plant and FY are selected.	Toast confirms physical count posted.
Correct scope: All, Bulk, Rolls, or Packing.	Audit sheet appears in Month close & history.
Correct location/roll form/granule code filter if partial.	Stock card movement matches the variance.
Only physically counted rows have counted qty.	Overview and closing preview refresh.
Reasons filled for variance over 2 percent.	Month-end snapshot can be captured when month work is complete.

Rollback-safe proof command for trainers:

```
/Users/devvarshthakkar/local_repos/erp total/venv/bin/python scripts/prove_stock_lifecycle_local_flow.py
```
